

[Replace the paragraph starting at page 26, line 3 with:]

119
corrected

In this invention, it is apparent that a wide range of different working modes can be formed on the basis of this invention without departing from the spirit and scope of the invention. This invention is not restricted by any specific embodiment.

IN THE ABSTRACT:

Please replace the Abstract with the following:

110

Image projection and display devices include a plurality of projectors, a projection screen forming a focusing plane for the projected images from the plurality of projectors, mutually overlapping regions existing between the images, a test image storing section for storing prescribed test images, and an image capturing section for acquiring projected test images in which a prescribed test image is projected. The devices further include a correction data calculating section for calculating correction data for correcting the input images for the respective projectors, on the basis of the acquired test images, in such a manner that a uniform or continuous brightness is achieved across the whole projection area including the overlapping regions, a correction data storing section for storing the correction data thus calculated, and an image correcting section for correcting the images input to the respective projectors, by using the correction data.
